	Interceptor Plus Heartworm Prev. - Green		3.00	\$18.18 T
Patient Subtotal:				\$113.18

InstructionsPOSSIBLE SIDE EFFECTS - VACCINATION

- Common side effects can include but are not limited to mild fever, decreased special behavior, diminished appetite or activity, sneezing (Bordetella only), discomfort or mild swelling at injection site. These common symptoms are usually self limiting. They typically resolve without treatment in 1-2 days.

- Rare side effects include but are not limited to swelling of the face and legs, repeated vomiting or diarrhea, whole body itching, difficulty breathing, and collapse. If you notice any of these rare symptoms, contact a veterinarian immediately.

- If your pet is non-responsive or lethargic, your pet may be experiencing hypoglycemia and veterinary attention should be sought immediately. If you are unable to get to a veterinarian, give small amounts of honey or corn syrup by mouth until your pet is responsive.

- After a heartworm check, we recommend that you keep your pet on a monthly prevention year-round for the duration of his/her life. We routinely recheck the heartworm test every 2 years to ensure your pet is heartworm negative.

HEARTWORM PREVENTION - Heartworm preventative is recommended monthly for pets in our area. Please use medication as directed. A heartworm test is recommended every 2 years. For future refills please call ahead so our staff can prepare your prescription in advance.
